Individual Income Tax Rates, 1984

By Daniel Holik and Robert Kalish*

Individual income tax data for Tax Year 1984 reflected both an expanding economy and the final phase of tax rate reductions mandated by the Economic Recovery Tax Act of 1981 (ERTA) [1, 2]. A \$202 billion increase in adjusted gross income (AGI) and a \$155 billion increase in taxable income led to a 10-percent increase in total income tax from \$274 billion for Tax Year 1983 to \$302 billion for Tax Year 1984, the first increase in tax since 1981 (Figure

A). On a return basis, the average total income tax on returns that showed a tax for 1984 was \$3,698, a \$184 increase from 1983, as shown in Figure B. (Constant dollar total-income tax per return data are also presented in Figure B).

The average tax rate on returns that showed a tax was 14.4 percent of AGI--down slightly from 1983. The AGI class of the median taxable

Figure A.--Adjusted Gross Income, Total Income Tax, Average Total Income Tax, and Average Tax Rate, 1979-1984

Taxable Returns: Average Tax Rate and Average Total Income Tax, 1979-1984

Dollars per Return

Note: Constant dollar data were derived using the Implicit Price Deflator for Personal Consumption Expenditures, U.S. Department of Commerce, Bureau of Economic Analysis

return for 1984 increased to between \$19,000 and \$20,000 from between \$17,000 and \$19,000 for 1983 [3]. For further information on the number of returns, income tax, and average tax by size of AGI, see Table 3 at the end of this report.

CALCULATION OF TAXES FOR 1984

For Tax Year 1984, taxpayers used one of four tax rate schedules, depending on the taxpayer's filing status. There were separate schedules for: married persons filing joint returns; married persons filing returns separately from their spouses; individuals qualifying as heads of households; and single individuals [4]. The tax rates in each schedule ranged from 0 to 50 percent [5].

The application of different tax rates from a schedule to a particular return is illustrated in Figure C, which shows how tax was calculated for 1984 for a married couple with a \$22,000 AGI filing a joint return and not itemizing their deductions. Taxpayers who filed joint returns for 1984 had a tax rate of 0 percent for the first \$3,400 of taxable income, a rate of 11 percent applied to the next \$2,100, a rate of 12 percent applied to the next \$2,100, and so forth.

Figure	CCalc	cula	tion	of	Tax,	Joint	Retur	n With
Income	Subject	to	Tax	at	Regula	ır Rate	es, 198	34

Adjusted gross income	\$22,000

Next				11%	231
Next				12%	252
Next	\$4,300	taxed	at	14%	602
Next	\$4,100	taxed	at	16%	656
Next	\$4,000	taxed	at	18%	720

Totals :	\$20,000	\$2,461

To simplify tax computation and reduce errors, taxpayers with less than \$50,000 of taxable income (except those using income averaging) were required to use the 1984 Tax Table instead of the tax rate schedules to determine tax. The tax shown in the Tax Table was equal to the tax on the midpoint of the income bracket (generally each bracket was \$50 wide), as calculated from the appropriate tax rate schedule, rounded to the nearest whole

dollar. According to the 1984 Tax Table, the tax for married taxpayers filing a joint return with \$20,000 to \$20,050 of income was \$2,466. Note that in this example, the Tax Table tax shown is greater than the tax computed from the tax rate schedule (Figure C), since the Tax Table tax was computed on the midpoint (\$20,025) of the \$20,000 to \$20,050 income bracket. The tax computed from the Tax Table or the tax rate schedules plus any "taxes from special computations" equals income tax before credits [6].

The regular and income averaging methods of tax computation were the only methods of tax computation available for Tax Year 1984 [7]. Choice of the income averaging computation permitted part of an unusually large amount of income for 1984 to be taxed at lower rates, thus resulting in a lower amount of tax due than would have resulted if taxpayers had computed their tax using the regular method. If the income averaging computation was used, the income tax before credits had to be computed from the tax rate schedules rather than the Tax Tables.

Certain income and deduction items, described as "tax preferences," were subject to the alternative minimum tax instead of tax computed from the tax rate schedules. For Tax Year 1984, the alternative minimum tax, if any, was imposed on "alternative minimum taxable income" at a 20 percent rate. Over 370,000 returns reported alternative minimum tax totaling \$4.5 billion for 1984. Tables 1 and 2 do not include any tax attributable to the alternative minimum tax, since this tax was computed on a different base.

Marginal Tax Rates

As shown in Figure C, a particular return can have portions of income taxed at many different rates. The marginal tax rate is the tax rate applied to the last dollar of income. Note that the marginal tax rate as defined in this manner for each return is based only on income included in AGI. Consequently, this marginal tax rate may differ from an effective marginal tax rate computed on a taxpayer's total income [8]. Since tax rates increase with income (from 0 to 50 percent), the marginal tax rate is the highest tax rate applied to the return. In Figure C, the taxpayers had portions of income taxed at six tax rates ranging from 0 percent to 18 percent. The marginal tax rate in this instance is 18 percent.

Marginal tax rate data for Tax Year 1984 are presented in Tables 1 and 2. Returns are classified by two different methods in Table 1. In columns 1 through 9, a return is classified by the marginal or highest rate. For example, Table 1, line 9, column 1, shows that there were 9,309,446 returns for which the marginal

tax rate was 18 percent. Columns 5 and 6 show that, for these returns, the amount of tax "generated" at the 11 through 18 percent rates totaled \$17.0 billion while the amount of tax generated solely at the marginal rate of 18 percent totaled \$2.8 billion. (Note that dollar amounts presented in this section and in the tables were rounded during statistical processing, therefore amount detail may not add to totals.) In columns 10 through 12, a return is classified by each rate that generated a tax. For example, line 9, columns 10, 11, and 12, show that 48,292,744 returns had income taxed at the 18 percent rate; \$151.1 billion of this income was taxed at the 18 percent rate and \$27.2 billion of income tax was generated at the 18 percent tax rate.

The amount of tax generated by each specific tax rate, ranging from 11 to 50 percent, as well as the corresponding number of returns and the amount of income subject to tax, are presented in Table 2. These data are classified by size of AGI. For example, line 9, columns 1, 7, 8 and 9, show that of the 4,906,140 returns with an AGI between \$14,000 and \$16,000 and with income subject to tax, 4,866,253 returns had a portion of income taxed at the 11 percent rate. These returns had \$8.0 billion of income subject to tax at the 11 percent rate, which generated \$0.9 billion of tax.

Definitions

Complete definitions of the technical terms used in this article and accompanying tables—for example, taxable income, tax generated and income averaging, are beyond the scope of this article. More extensive definitions may be found in the Statistics of Income--1984 Individual Tax Returns. Brief definitions of the major tax concepts discussed in this article follow:

Adjusted Gross Income.--Adjusted gross income (AGI) was computed by subtracting statutory adjustments (primarily business, investment or employee-related deductions, such as payments to an Individual Retirement Arrangement (IRA)), from total income recognized under the tax code. Total income included the net amounts from sources such as salaries and wages, business income, rents, royalties and, in turn, excluded, for example, most social security benefits, and a certain portion of capital gains.

Total Income Tax.--Total income tax was the sum of income tax after credits and the additional tax for tax preferences (primarily the alternative minimum tax and minimum tax on prior-year returns processed during the current-year filing period).

Average Tax Rate.--The average tax rate presented in this article was the ratio of total income tax to AGI.

Marginal Tax Rate.--The marginal tax rate presented in this article was the highest tax rate applied to any portion of income from a return. Note that the marginal tax rate, as defined for the data presented in this article, is based only on income included in AGI. As defined in this manner, the marginal tax rate may differ from an effective tax rate computed on total income.

Income Subject To Tax.--Income subject to tax was the technical term used to describe the actual tax base computed for the statistics. For taxpayers using the regular tax computation method, income subject to tax was identical to "taxable income" (AGI less the personal exemption amount, and less either allowable charitable contributions for non-itemizers or allowable itemized deductions). For taxpayers using the income averaging method, income subject to tax was specially computed for the statistics by working backwards from the tax and imputing an income from the tax reported as if income averaging had not been used.

Tax Generated.--This was the tax computed from the tax rate schedules on the amount of income subject to tax shown in the statistics. For most returns (those without one of the "taxes from special computations"), tax generated equalled income tax before credits.

DATA SOURCES AND LIMITATIONS TO THE REPORT OF THE PARTY O

These statistics are based on a sample of individual income tax returns (Forms 1040, 1040A, and 1040EZ) filed with the Internal Revenue Service in 1985. Returns in the sample were stratified based on the presence or absence of Schedule C, Profit (or Loss) from Business or Profession; State for which filed; adjusted gross income or deficit, or largest of selected sources of income or loss; and size of business plus farm receipts. Returns were selected at rates ranging from 0.03 percent to 100 percent, resulting in 94,422 returns being selected from a population of 99,579,174.

Because the data presented in this article are estimates based on a sample, they are subject to sampling, as well as nonsampling, error. To make proper use of the statistical data provided, one must know the magnitude of the potential sampling error.

The following table presents approximate coefficients of variation (CV's) for frequency estimates. The approximate CV's shown here are intended only as a general indication of the reliability of the data.

For a number other than those shown, the corresponding CV's can be estimated by interpolation.

Number of Returns	Approximate Coefficient of Variation
11,430,600	0.02
1,900,900	0.05
457,200	0.10
118,800	0.20
52,800	0.30
19,000	0.50

The reliability of estimates based on samples, the use of coefficients of variation for evaluating the precision of sample estimates, and nonsampling error considerations are discussed in the Appendix.

NOTES AND REFERENCES

- [1] The Economic Recovery Tax Act of 1981 also provided for indexing of the tax rate schedules, zero bracket amount, and the exemption amount, beginning with Tax Year 1985.
- [2] For further information on tax law changes for 1984, see the <u>Statistics of Income--</u>1984, Individual Income Tax Returns.
- [3] A return was considered to be taxable if "total income tax" (the sum of income tax after credits and additional tax for tax preferences) was greater than zero. "Total income tax" did not include other related taxes reported on the individual income tax return, such as tax from recom-

- puting prior-year investment credit, selfemployment tax, social security tax on tips, etc.
- [4] Taxpayers claiming surviving spouse status used the same tax rate schedule as married taxpayers filing joint returns.
- [5] The 1984 tax rate schedules were published in the 1984 Instructions for Preparing Form 1040, page 42.
- [6] Taxes from special computations included tax on accumulation distributions of trusts, and the tax on the ordinary income part of lump-sum distributions from qualified retirement plans.
- [7] Tables 1 and 2 include returns with the regular or the income averaging tax computation and use the concept of income subject to tax. For returns with the regular method of tax computation, income subject to tax was the amount taxpayers used with the tax tables or the tax rate schedules to determine tax. Income averaging returns are shown in the same manner as returns with the regular tax computation, except that an imputed income subject to tax that does not take averaging into account is used to simplify statistical processing in determining the marginal tax rate.
- [8] For example, \$1 of capital gains income generated \$0.40 of AGI (after the capital gains exclusion) subject to the 50 percent marginal tax rate. While the stated marginal tax rate on AGI was 50 percent, the effective marginal tax rate computed on total income was 20 percent.
